```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The G-protein coupled receptor polynucleotide and polypeptide are useful as pharmaceuticals or in the manufacture of medicaments for the treatment of obesity. They are useful in the diagnosis and treatment of diseases and disorders associated with signal transduction such as obesity diabetes and metabolic disease, neurological disease, psychotherapeutics, urogenital disease, inflammation, cancer, tissue repair, dermatology, skin pigmentation, photoageing, frailty, performance of the statement of the protein and th

                                                                                                                                                       disorder affecting the brain or a genetic predisposition, specifically schizophrenia. ngPCRx are useful for identifying compounds useful for treating schizophrenia. Detection of ngPCRx in a sample is useful as a diagnostic tool for diseases or disorders e.g. thyroid disorders, renal failure, rheumatoid arthritis, CNS disorders, infections such as HIV-1, metabolic and cardiovascular diseases, proliferative disorders and
                                                                       treating neurological disorders, including schizophrenia, ADHD/ADD (attention deficit-hyperactivity disorder/attention deficit disorder), and neuronal disorders such as Alzheimer's disease, Parkinson's disease migraine and senile dementia. Additional disorders include inflammatory
                                                                                                                                                                                                                                                     The present invention relates to novel G protein-coupled receptors (nGPCRX; where x is 1, 3, 4, 5, 9, 11, 12, 14-18, 20, 21, 22, 24, 27, 28, 31-38, 40, 41, 53-60) and their coding sequences. The present sequence is one such G protein-coupled receptor. GPCRs are also known as seven transmembrane receptors and function in signal transduction. The nGPCRx coding sequences are useful for screening a human to diagnose a discourage of the coding sequences are useful for screening a human to diagnose a
Sequence
                           conditions (e.g. Crohn's disease), rheumatoid arthritis, disorders, cancers, respiratory ailments such as asthma, diseases e.g. inflammatory bowel disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Vogeli G,
Schellin

           polynucleotides are useful for preventing, ameliorating or correcting dysfunctions or diseases. These diseases include peripheral nervous system, psychiatric and central nervous system disorders (e.g. schizophrenia, episodic paroxysmal anxiety, phobia, Parkinson's disease, migraine, epilepsy, bulimia or stroke), cardiovascular disease (e.g. heart failure, angina pectoris, myocardial infarction or hypertension), dyslipidemias, obesity, emesis, gastrointestinal disorders (e.g. inflammatory bowel disease or motility disorders), osteoporosis, inflammations, infections (e.g. bacterial, fungal, protozoan or viral), pain, cancers, lumune disorders, allergies, sepsis or gynecological disorders of the nervous system, including the central and peripheral nervous systems, disorders of the gastrointestin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; G-protein coupled receptor; IGS4; IGS4A; IGS4B; schizophrenia; nervous system disorder; psychiatric disorder; Parkinson's disease; episodic paroxysmal anxiety; phobia; migraine; epilepsy; bulimia; str. cardiovascular disease; heart failure; angina pectoris; obesity; emes; motility disorder; myocardial infarction; hypertension; dyslipidemia; gastrointestinal disorder; inflammatory bowel disease; osteoporosis; inflammation; infection; pain; cancer; immune disorder; allergy; seps:
                                                                                                                                                                                                           The present sequence represents a splice variant of the short version a human G-protein coupled receptor designated IGS4A. IGS4 exists in topolymorphic forms, IGS4A and IGS4B. The IGS4 receptors and IGS4

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      hypertension), dyslipidemias, obesity, "emesis, gastrointestinal disorders (e.g. inflammations bowel disease or motility disorders), osteoporosis, inflammations, infections (e.g. bacterial, fungal, protozoan or viral), pain, cancers, immune disorders, allergies, sepsis or gynecological disorders. Agonists or antagonists of IGS4 are effective with regard to disorders of the nervous system, including the central and peripheral nervous systems, disorders of the gastrointestinal system, cardiovascular system, skeletal muscle, thyroid, lung or genitourinary system, or immunological disease. The IGS4 polynucleotides are useful as diagnostic reagents for detecting under-expression, overexpression or altered expression of IGS4.

IGS4 exists in two polymorphic forms, IGS4A and IGS4B. The IGS4 receptors and IGS4 polynucleotides are useful for preventing, ameliorating or correcting dysfunctions or diseases. These diseases include peripheral nervous system, psychiatric and central nervous system disorders (e.g. schizophrenia, episodic paroxysmal anxiety, phobia, Parkinson's disease, migraine, epilopsy, bulinia or stroke), cardiovascular diseases for heart failure applicable, but in a contraction or stroke).

Agonists or antagonists of IGS4 are effective with regard to disorders of the nervous system, including the central and peripheral nervous systems, disorders of the gastrointestinal system, cardiovascular system, skeletal muscle, thyroid, lung or genitourinary system, or immunological disease. The IGS4 polynucleotides are useful as diagnostic reagents for detecting under-expression,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               24-SEP-1999;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence represents the short version of a human G-protein coupled receptor designated IGS4B. IGS4 exists in two polymorphic forms, IGS4A and IGS4B. The IGS4 receptors and IGS4 polynucleotides are useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           useful for preventing, ameliorating disorders, cardiovascular diseases,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                overexpression or altered expression of IGS4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 18;

     The present amino acid sequence is the hRUP6, an endogenous human orphan 6 protein-coupled receptor (GPCR). The full length hRUP6 cDNA was cloned by RT-PCR using human thymus cDNA as template. The orphan GPCR of the invention, like all GPCRs has seven transmembrane alpha helices with an extracellular N-terminus and an intracellular C-terminus. However, no endogenous ligands, and to screen jedentified for the proteins of the invention. The orphan GPCRs may be used in the identification of their endogenous ligands, and to screen potential GPCR agonists and antagonists for use as pharmaceutical agents. The proteins may also be used in the study of GPCR-mediated signalling cascades, and to elucidate their precise role in normal and diseased human conditions. Nucleic acid encoding human orphan GPCRs may be used for tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                               28-MAY-1

More specifically the present invention relates to non-endogenous, constitutively activated versions of a human GPCR. These non-endogenous human GPCRs can be useful for the direct identification of candidate compounds as receptors agonists, inverse agonists or partial agonists for use as pharmaceutical agents.
